## Utility-Scale Firm Clean Baseload + 45V Hydrogen Co-Product

Supercritical NH<sub>3</sub> + dissolved alkali · Heritage  $\sigma$ -sidestep · Multi-pass Faraday channel

A2 Meridian is Aurora's utility-scale clean firm specialist: a 50 MWe multi-pass Faraday MHD generator using **supercritical NH<sub>3</sub> (18 MPa) with dissolved alkali** as both working fluid and  $\sigma$  source — a chemistry-mediated heritage sidestep that avoids the seeded-combustion plasma failure mode that ended 1989-1993 DOE Faraday MHD programs. AmmoBurst pre-conditioning provides thermal regeneration and a \$45V Clean Hydrogen byproduct stream that uplifts buyer project IRR by 1.5-2.6 percentage points.

### WHY A2 MERIDIAN

A2 is the only utility-scale clean firm generator that combines (a) zero-emission \$45Y eligibility, (b) \$45V H<sub>2</sub> byproduct revenue, (c) dramatically lower CAPEX than Allam-Fetvedt or NuScale SMR alternatives at the same scale, and (d) heritage sidestep IP that solves the 1993 DOE Faraday MHD failure modes. For premium clean firm utility buyers, A2 delivers **20.1% project IRR** with 5-year payback on \$98M total project CAPEX — clearing utility hurdle rates by 10+ percentage points.

### HERITAGE SIDESTEP — THE $\Sigma$ INNOVATION

Heritage 1989-1993 DOE Faraday MHD programs (U-25, Avco Mark V/VI, CDIF) failed because **alkali-seeded combustion plasma** as a  $\sigma$  source produced slag chemistry attack on electrodes, continuous Cs makeup consumption, and unworkable economics. A2 sidesteps this through:

- ✓ **SC-NH<sub>3</sub> at 18 MPa working fluid** — supercritical ammonia provides clean high-temperature transport without combustion products in the MHD channel
- ✓ **Dissolved alkali  $\sigma$  source** — alkali salts dissolved in the SC fluid generate  $\sigma \geq 500$  S/m via chemistry-mediated pathway, NOT seeded combustion plasma
- ✓ **3-pass toroidal channel topology** — multi-stage JxB extraction at lower per-pass field requirements than single-pass heritage designs
- ✓ **AmmoBurst pre-conditioning** — NH<sub>3</sub>  $\leftrightarrow$  N<sub>2</sub> + 3H<sub>2</sub> catalytic chemistry provides thermal regeneration AND \$45V H<sub>2</sub> byproduct revenue

### TARGET BUYERS · TODAY

Regulated utilities under CES mandates · Industrial cogen host sites with NH<sub>3</sub> infrastructure · Premium clean firm IPPs with utility PPA · Industrial decarbonization customers (chemical, steel, cement) needing 24/7 clean baseload · Microgrids requiring islanding-capable utility-scale firm power.

## Power, Efficiency & Operating Envelope

Net electrical output	50 MWe	Continuous baseload · grid-firm dispatch · already net of AmmoBurst slipstream
Net cycle efficiency ( $\eta$ )	0.50	Electrical out / NH <sub>3</sub> thermal in · target design point
NH <sub>3</sub> feedstock intensity	~387 kg/MWh-e	At $\eta = 0.50$ · NH <sub>3</sub> LHV 5.17 kWh/kg · drives fuel cost economics
Operating temperature (peak)	~2,000 K	SC-NH <sub>3</sub> + dissolved alkali peak · MHD channel inlet
Operating pressure	18 MPa	Supercritical ammonia · 4-6× CCGT operating pressure · drives compact channel
$\sigma$ target (sustained)	500-1,000 S/m	Chemistry-mediated via dissolved alkali · NOT seeded combustion plasma
Capacity factor (typical)	85-90%	Utility-scale baseload · maintenance windows for AmmoBurst catalyst
Grid voltage interconnection	138 / 230 / 345 kV	Transmission-class · system impact study typically required

## Working Fluid & $\sigma$ Mechanism

MHD working fluid	SC-NH <sub>3</sub> + dissolved alkali	Supercritical ammonia at 18 MPa · alkali salts dissolved in fluid
$\sigma$ generation mechanism	Dissolved alkali in SC fluid	Chemistry-mediated · NOT alkali-seeded combustion plasma · heritage sidestep
Channel topology	3-pass toroidal Faraday	Multi-stage J×B extraction · lower per-pass field requirements
AmmoBurst pre-conditioning	NH <sub>3</sub> ↔ N <sub>2</sub> + 3H <sub>2</sub>	MOF-catalyst chemistry · regenerative heat transfer · H <sub>2</sub> slipstream
H <sub>2</sub> byproduct slipstream	~5% of NH <sub>3</sub> feedstock	Sized to ~1,270 t H <sub>2</sub> /yr at 85% CF · \$45V revenue
HTS magnet system	15 T REBCO conduction-cooled	Modern HTS technology enables compact MHD channel
Combustion in MHD channel?	None	Heritage sidestep · qualifies \$45V without CCUS

## Physical Envelope

Site footprint (deployed)	~10 acres	Includes MHD module · NH <sub>3</sub> storage (700 t · 2-day) · cooling · interconnect
MHD module dimensions	~12 m × 4 m × 4 m	Multi-pass Faraday channel + HTS magnet + AmmoBurst integration
NH <sub>3</sub> infrastructure	2-day onsite storage	700-tonne refrigerated tanks · transfer pumps · vapor recovery
Construction period	24 months	Vs Allam-Fetvedt 36-48 mo · vs NuScale SMR 60-84 mo
Cooling requirements	~15,000 gpm	Wet cooling tower or dry-cooled option for water-stressed sites

### \$45V H<sub>2</sub> BYPRODUCT REVENUE STREAM — ARCHITECTURALLY UNIQUE TO A2

A2's AmmoBurst slipstream produces ~1,270 tonnes/yr of clean H<sub>2</sub> that qualifies for \$45V Clean Hydrogen PTC. Tier eligibility depends on upstream NH<sub>3</sub> source carbon intensity:

- **Tier 1** (\$3.00/kg) · green NH<sub>3</sub> source · <0.45 kg CO<sub>2</sub>e/kg H<sub>2</sub>
- **Tier 2** (\$1.00/kg) · blue NH<sub>3</sub> source · 0.45-1.5 kg CO<sub>2</sub>e/kg H<sub>2</sub>
- **Tier 3** (\$0.75/kg) · low-Cl grey NH<sub>3</sub> · 1.5-2.5 kg CO<sub>2</sub>e/kg H<sub>2</sub>

At Tier 2 (blue NH<sub>3</sub>) baseline: **\$1.27M/yr H<sub>2</sub> revenue, +1.5 pts buyer IRR**. At Tier 1 (green NH<sub>3</sub>) upgrade: **\$3.81M/yr H<sub>2</sub> revenue, +4.5 pts buyer IRR**.

# How It Works

## Operating Cycle

A2 operates as a **supercritical-fluid heritage-sidestep generator** with H<sub>2</sub> co-production. NH<sub>3</sub> feedstock undergoes AmmoBurst pre-conditioning (NH<sub>3</sub> ↔ N<sub>2</sub> + 3H<sub>2</sub> catalytic chemistry) for thermal regeneration. The supercritical NH<sub>3</sub> + dissolved alkali working fluid traverses a 3-pass toroidal Faraday channel where  $\sigma \geq 500$  S/m is generated chemistry-mediated by dissolved alkali — not by combustion plasma. Multi-pass JxB extraction yields 50 MWe net at  $\eta = 0.50$  cycle efficiency. A 5% NH<sub>3</sub> slipstream produces clean H<sub>2</sub> byproduct for \$45V revenue.

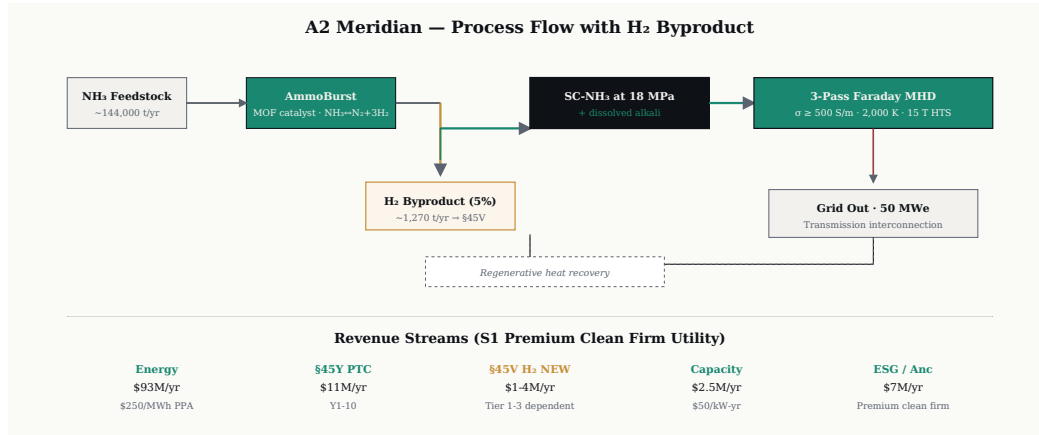

Figure 1 · A2 Meridian process flow showing AmmoBurst pre-conditioning, SC-NH<sub>3</sub> working fluid, and \$45V H<sub>2</sub> byproduct slipstream

## Subsystem Architecture

A2-01 · NH <sub>3</sub> Feedstock System	700 t storage	Refrigerated NH <sub>3</sub> tanks · pipeline or truck delivery · 2-day onsite buffer · vapor recovery
A2-02 · AmmoBurst Pre-Conditioner	MOF-catalyst	NH <sub>3</sub> ↔ N <sub>2</sub> + 3H <sub>2</sub> reversible chemistry · regenerative heat from MHD exhaust · H <sub>2</sub> slipstream sized to byproduct revenue target
A2-03 · SC-NH <sub>3</sub> Conditioning	18 MPa supercritical	Compression to 18 MPa · alkali salt dissolution · heating to ~2,000 K · feeds MHD channel
A2-04 · 3-Pass Faraday Channel	Toroidal topology	Multi-stage JxB extraction · 15 T REBCO HTS magnet · Cs-vapor electrode interfaces · 50 MWe net
A2-05 · H <sub>2</sub> Recovery & Purification	Membrane separation	~1,270 t H <sub>2</sub> /yr at 99.97% purity · \$45V tier eligibility based on upstream NH <sub>3</sub> CI
A2-06 · Power Conditioning	DC → 138 kV AC	High-voltage transmission interconnect · IEEE 1547 + transmission requirements
A2-07 · Aurora NeuroControl	Real-time AI/ML	Plasma control transferred from tokamak fusion · adaptive $\sigma$ optimization · grid dispatch

## Pricing & Project Economics

Aurora turnkey contract	\$55-70M (\$62M mid)	50 MWe utility-scale unit · 24-month delivery from PO · includes commissioning
Total project CAPEX (typical)	\$92-98M	Includes site civils (\$4M), interconnect (\$8M), NH <sub>3</sub> infrastructure (\$6M), permitting, owner's costs, IDC
\$/kW project basis	\$1,834-1,964/kW	Dramatically lower than Allam-Fetvedt (\$2,000-3,000/kW) and NuScale SMR (\$5,000-10,000/kW)
LCOE (S1 Premium Clean Firm)	~\$280/MWh	At blue NH <sub>3</sub> \$600/t · Tier 2 H <sub>2</sub> byproduct uplift
LCOE (S2 Industrial Cogen)	~\$155/MWh	At onsite NH <sub>3</sub> \$350/t · Tier 1.5 H <sub>2</sub> byproduct uplift · process heat sales

### THREE-SCENARIO PROJECT IRR (WITH \$45V H<sub>2</sub> BYPRODUCT UPLIFT)

<b>S1</b> Premium Clean Firm Utility		<b>20.1%</b>
<b>S2</b> Industrial Cogen Host		<b>22.4%</b>
<b>S3</b> Merchant IPP (stress test)		<b>NEG</b>

S1: 18.6% energy-only baseline + 1.5 pts \$45V H<sub>2</sub> byproduct = 20.1% · S2: 19.8% baseline + 2.6 pts H<sub>2</sub> uplift = 22.4% · S3 fails decisively — A2 cannot survive merchant pricing regardless of H<sub>2</sub> revenue

**Best-fit buyer:** A2 fits S2 Industrial Cogen Host precisely — industrial NH<sub>3</sub> pipeline access reduces fuel cost to \$350/t, BTM avoidance captures \$12M/yr demand charges + \$8M/yr process heat, AmmonoBurst H<sub>2</sub> byproduct provides \$1.9M/yr at Tier 1.5 onsite blue/green pricing. **S2 Project IRR: 22.4% with 5-year payback on \$92M total project CAPEX.**

## Revenue Streams (S1 Premium Clean Firm Utility)

Energy contract (PPA)	\$93.1M/yr	\$250/MWh × 372,300 MWh-e/yr at 85% CF
ESG premium	\$5.6M/yr	24/7 CFE verified · clean firm category pricing premium
Capacity payments	\$2.5M/yr	\$50/kW-yr · ISO market or utility regulated
\$45Y Clean PTC (Y1-10)	\$11.2M/yr	\$30/MWh · 10-year window · prevailing-wage qualified
\$45V H <sub>2</sub> byproduct (NEW)	\$1.3M/yr	~1,270 t H <sub>2</sub> /yr at \$1.00/kg Tier 2 (blue NH <sub>3</sub> ) · architecturally unique to A2
Ancillary services	\$1.5M/yr	Frequency regulation · spinning reserve · voltage support
Year 1 total revenue	<b>\$115.1M</b>	Y11+ post-PTC: \$103.9M annual

## Why Aurora · Competitive Positioning

vs Allam-Fetvedt cycle (50 MW)	Lower CAPEX, no CCUS	A2 \$1,904/kW vs \$2,000-3,000/kW · A2 zero-emission without CO <sub>2</sub> capture/sequestration · A2 has H <sub>2</sub> byproduct revenue
vs NuScale SMR (60 MW)	2-5× lower CAPEX	A2 \$98M vs \$250-500M · A2 24-mo construction vs 60-84 mo · no nuclear permitting
vs CCGT (50 MW, gas)	Clean firm classification	A2 qualifies \$45Y · A2 zero direct emissions · CCGT loses ESG positioning
vs CCGT + CCUS (50 MW)	No CO <sub>2</sub> infrastructure	A2 doesn't require CO <sub>2</sub> pipeline / sequestration / monitoring
vs Solar 150 MW + 4-hr Li BESS	True 24/7 firm	A2 dispatchable baseload · vs intermittent + BESS replacement Y10

### AURORA'S HERITAGE SIDESTEP IP

- ✓ **SC-NH<sub>3</sub> + dissolved alkali σ mechanism** — fundamentally different electrochemistry than 1989-1993 DOE Faraday MHD failure (US patents pending DI-A2-001 through DI-A2-008)
- ✓ **3-pass toroidal Faraday channel topology** — multi-stage JxB extraction reduces per-pass field requirements
- ✓ **AmmonoBurst MOF catalyst** — NH<sub>3</sub> ↔ N<sub>2</sub>+3H<sub>2</sub> reversible chemistry · regenerative heat + \$45V H<sub>2</sub> byproduct (architecturally unique to A2)
- ✓ **15 T REBCO HTS magnet integration** — modern HTS technology enables compact Faraday channel at utility scale
- ✓ **Aurora NeuroControl** — AI/ML real-time plasma control · 32-month head start on competitors

### PATH TO COMMERCIAL OPERATION

- **Stage 1 (2026)** — Pre-hardware validation · Stage 1 components for SC-NH<sub>3</sub> containment, alkali dissolution chemistry, AmmonoBurst catalyst · \$20-32M Aurora budget
- **Stage 2 (2027-2029)** — FOAK build at industrial host site or utility partner · 36-month integrated commissioning
- **Stage 3 (2030+)** — Volume production · 2-3 units/year by 2032 · NH<sub>3</sub> supply chain consolidation · cost-down to \$55M turnkey

**Critical Risk - NH<sub>3</sub> Supply Chain:** A2 commercial readiness depends on parallel maturation of utility-scale NH<sub>3</sub> infrastructure that Aurora doesn't directly control. The S5 Pivot scenario (5% probability in Plan §07) explicitly acknowledges A2 may fail to materialize commercially if NH<sub>3</sub> infrastructure doesn't develop or AmmoBurst MOF catalyst durability falls short. Aurora's Plan §02 identifies NH<sub>3</sub> procurement and AmmoBurst MOF as A2-critical supply chain items requiring vendor consolidation.
